The Modern Library Dictionary of the English Language

Offers a wider perspective on Darwin's scientific theory of natural selection, explaining how it extends beyond biology, analyzing current controversies over the origins of life and inherent biases, and challenging popular philosophies

Fungi research and knowledge grew rapidly following recent advances in genetics and genomics. This book synthesizes new knowledge with existing information to stimulate new scientific questions and propel fungal scientists on to the next stages of research. This book is a comprehensive guide on fungi, environmental sensing, genetics, genomics, interactions with microbes, plants, insects, and humans, technological applications, and natural product development.

An Unproclaimed Empire: The Grand Duchy of Lithuania is an interdisciplinary study of the Grand Duchy of Lithuania (GDL) that is historical in subject but social scientific in approach. It is also the first study to apply this comparative and social scientific method to the GDL. In this book, Zenonas Norkus draws on national historiographies and applies theories from comparative empire studies involving historians, sociologists, political scientists, anthropologists and scholars in the theory of international relations, allowing it to transcend differences in national viewpoints. It also provides answers to contested issues in the history of the GDL, and raises a number of new questions, including whether the Grand Duchy was an empire or a federation, and why and when it failed. By adopting this "imperial approach" of considering the GDL as an empire, this book brings something new to the research surrounding the Grand Duchy and is ideal for academics and postgraduates of early modern Lithuania, early modern Eastern Europe, historical sociology, and the history of empires.

Evolution and the Meanings of Life

The Biology Laboratory Manual by Vodopich and Moore was designed for an introductory biology course with a broad survey of basic laboratory techniques. The experiments and procedures are simple, safe, easy to perform, and especially appropriate for large classes. Few experiments require more than one class meeting to complete the procedure. Each exercise includes many photographs, traditional topics, and experiments that help students learn about life. Procedures within each exercise are numerous and discrete so that an exercise can be tailored to the needs of the students, the style of the instructor, and the facilities available.

This full-color, comprehensive, affordable introductory biology manual is appropriate for both majors and nonmajors laboratory courses. All general biology topics are covered extensively, and the manual is designed to be used with a minimum of outside reference material. The activities emphasize the unity of all living things and the evolutionary forces that have resulted in, and continue to act on, the diversity that we see around us today. An extensive full-color art and photography program includes many specimen and dissection images, labeled diagrams, cladograms, and helpful life-cycle illustrations. In addition to providing the necessary images to help students work through the lab procedures, the manual also includes hundreds of images of representative organisms, providing ample visual support for the lab. Check Your Understanding questions after each exercise ask thought-provoking questions in order to measure student progress throughout the chapter. A Chapter Review ends each chapter and provides thoughtful questions to ensure that students understand the overall concepts from the chapter.

Op welke manieren bepalen gedachten je leven? Bruce Lipton deelt in De biologie van de overtuiging de ontdekking dat gedachten en emoties ons welbevinden kunnen beïnvloeden. In 'De biologie van de overtuiging' maakt Bruce Lipton ons deelgenoot van zijn verpletterende ontdekking dat we geen slachtoffer zijn van onze genen, maar dat we ons welbevinden kunnen beïnvloeden door onze gedachten, emoties en overtuigingen. Dr. Bruce Lipton komt tot deze conclusie na uitgebreid onderzoek naar de moleculaire processen waarmee cellen informatie verwerken. Daaruit bleek dat het niet de genen zijn die ons gedrag bepalen, maar dat de genen worden aan- en uitgezet door externe factoren. Ze worden getriggerd door onze waarnemingen en onze gedachten en overtuigingen. Professor Lipton toont aan dat overtuigingen, of ze nu waar zijn of niet, positief of negatief, de activiteit op genetisch niveau beïnvloeden en zelfs onze genetische code kunnen veranderen. Dr. Liptons uiterst hoopvolle bevindingen worden beschouwd als een van de grote doorbraken in de nieuwe wetenschap. Het lijkt erop dat we ons bewustzijn zodanig kunnen trainen dat we gezonde overtuigingen kunnen scheppen. Daarmee hebben we de sleutel in handen tot een gezonder en gelukkiger leven. In deze nieuwe editie is 10 jaar nieuw onderzoek opgenomen, wat dit belangrijke boek nog meer gewicht geeft. Tien jaar na dato zet 'De biologie van de overtuiging' van Bruce Lipton je nog steeds op scherp!
