It discusses technologies being developed, methods being implemented, and which of these are the most promising. The text encompasses tissue engineering, biomaterial sciences, stem cell biology, and developmental biology, all from a transplant perspective. Organ systems considered include liver, renal, intestinal, pancreatic, and more. Leaders from both fields have contributed chapters, clearly illustrating that regenerative medicine and solid organ transplantation speak the same language and that both aim for similar medical outcomes. The overall theme of the book is to provide insight into the synergy between organ transplantation and regenerative medicine.

When Dr. David Cundiff called me with a proposal to help research and write The Right Medicine I was intrigued but skeptical. His ideas for reform of the US health care system were visionary, radical, and highly original-but would they work? As a Wall Street analyst and long-time student of the health care system, I had my doubts. I had read David's book on hospice care, Euthanasia Is Not the Answer, and was impressed. And I had recently witnessed the slow death of my grandmother from the complications of Alzheimer's disease. Despite the fact that she was and had been suffering for years and despite the fact that her care was an extraordinary emotional and financial burden, nursing home administrators and physicians encouraged one last ditch treatment after another, pulling her back each time from the brink of what would have been a merciful death. I knew that David was correct in his contention that hospice care and a more sparing application of high technology medicine were major keys to improving health care. I also realized, after a decade of analyzing the health care industry, that a government-funded system along the lines of Canada's was probably the only way to rein in rampant inflation and provide universal coverage. But David had other ideas, too. He argued that preventive care could dramatically cut both the incidence and costs associated with the most common causes of illness in America today.

After reviewing the history of cancer and its impact on the population, Dr. Faguet exposes the antiquated notions that have driven cancer drug development, documents the stagnation in treatment outcomes despite major advances in cancer genomics and growing NCI budgets, and identifies the multiple factors that sustain the status quo. He shows that, contrary to frequent announcements of breakthroughs, our current cancer control model cannot eradicate most cancers and the reasons why. Significantly, this book also delineates a way forward via a shift from the discredited cell-kill approach of the past to an integrated, evidence-driven cancer control paradigm based on prevention, early diagnosis, and pharmacogenomics. The author's views are based on data published in mainstream scientific journals and other reliable references, 432 of which are cited.
